

Table 1.2: Differences between ExPD and the Phased-and-Gated Process

| System Element | ExPD | Phased-and-Gated Process |
|--------------------------------|---|---|
| Process characteristics | <p>The product drives the product development process</p> <p>Adaptable activities</p> <p>Activities and timing are based on the uncertainty and risk of the project. Iterative risk reduction is the primary principle behind the process and structure</p> | <p>The process drives the development of the product</p> <p>Sequential activities</p> <p>Activities and documentation are prescribed within each phase</p> |
| Strategic framework | <p>Strategy and roadmaps are tightly integrated into the product development process</p> <p>Strategy is adaptable; based on the enterprise's environment/market</p> | <p>Strategy and roadmaps are treated separately from the product development process</p> |
| Resource Management | <p>Prioritization and allocation of projects and resources are executed in real-time to prevent delays and overloading the pipeline</p> | <p>The assignment of resources is not directly incorporated within the product development process. Resource management may be addressed at regular intervals, such as at a portfolio management meetings</p> |
| Risks | <p>Risks drive the process</p> <p>Critical risks are pulled forward for resolution, enabling "learn fast and adapt" decisions</p> <p>Risks are explicitly identified, evaluated, and prioritized at the project's onset and revisited and updated during the entire process</p> | <p>Prescribed activities drive the process.</p> <p>Risk identification and the process generally start at the development phase when technology risks are high</p> |
| Documentation | <p>Modular, targeted documentation is reusable. Project teams document only the assumptions they are resolving</p> | <p>Documentation addresses all aspects of the project with increased detail at each phase</p> |
| Decision-making | <p>The team has clear guidelines on resources, budgets, and timelines</p> <p>Decision-making is decentralized, and management by exception is incorporated</p> <p>The project team can recommend adapting the project quickly at any time</p> | <p>Monthly gate meetings are typical. Gatekeepers make decisions (go, cancel, recycle, hold)</p> <p>Gatekeeper involvement depends upon the organization (management, director, or senior level)</p> |
| Team skills | <p>More experienced project leads typically lead the team</p> <p>Team members are open to ambiguity</p> | <p>Less experienced project leads can lead the team</p> <p>Team members require structure and a formula to follow</p> |
| Product types | <p>ExPD can work across all product types. It is especially beneficial for products with a high level of uncertainty</p> <p>ExPD can be used for hardware and/or software</p> | <p>Teams typically have different process paths, depending on product type: full process for new or complex products, a lite process for revisions</p> <p>It is not recommended for software products</p> |
